Supplementary Material: Reliable Strictly Local Floorplan Editing

Anonymous Submission

1 Protocol Boundaries

Oracle-control rows are capacity evidence and are not deployable. Predicted controls are target-free at inference. Aligned, canonical-instance, and typed graph metrics are separate protocols. Raw fpeval watertightness is always reported independently of functional and componentwise diagnostics.

2 Operation-Success Predicates

Room type and addition require the requested target class to dominate changed pixels. Room removal requires source-class removal or merging. Object deletion requires removal of the requested family. The old control source is an allowed editing input; source drift is reported separately from locality violations.

3 Reviewer-Facing Evidence

The main paper reports positive oracle evidence and retained predicted-control limitations. The development test exposure is not presented as held-out evidence. A fresh held-out run is required after the model and thresholds are frozen.

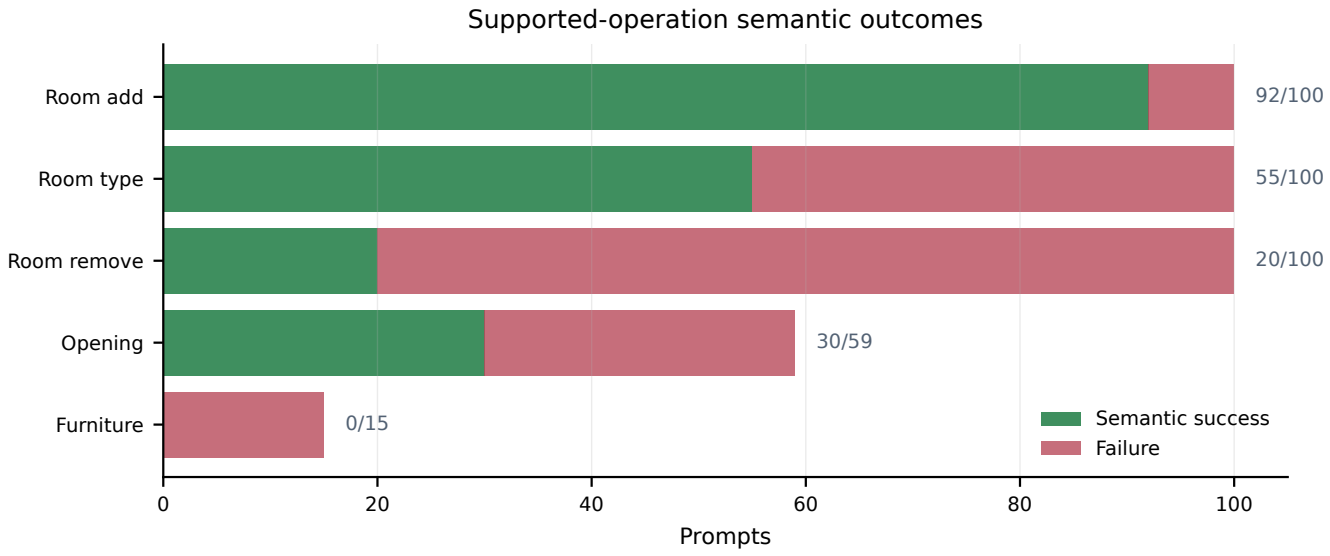

Figure 1: Semantic outcomes for supported operations with the actual prompt denominator. Failures are retained and are not reclassified as abstentions.
